WHERE IT GOES

This part in colour, its neighbours in grey

HOW TO MAKE IT AND HOW IT FITS

Cut 530 mm of 25 x 25 x 2 tube; square and deburr both ends.
Measure every hole from the root end (the end that bears on the saddle).
Through both side walls, on the centre line: 6.6 mm at 12 and 32
(cheek bolts) and 5.5 mm at 500 (anemometer mast cross bolt).
Through the top and bottom walls, on the centre line:
5.5 mm at 178.3 and 270.3 (shield rods),
10.5 mm at 424.3 (globe hanger tube),
16.5 mm at 500.0 (anemometer mast; step drill).
Drill each top and bottom pair in one pass on a drill press so they
line up; the arm-holes picture in the plan repeats these figures.
Push the end plug into the tip and slide the two crush sleeves in
from the root end to line up with the cheek bolt holes.
Check: a drill of each hole size passes straight through each pair.
